

system.tag.scan

This function is used in **Python Scripting**.

Description

Forces execution of a scan class. On a leased scan class, if both the fast and slow rate are set to 0, this will not execute

Client Permission Restrictions

This scripting function has no [Client Permission](#) restrictions.

Syntax

system.tag.scan(provider, sname)

- Parameters

- String** provider - The name of the scan class provider. If blank, it will use the default. Required if used in the gateway scope.

- String** sname - The name of the scan class to execute.

- Returns

- nothing

- Scope

- All

Code Examples

Code Snippet

```
# This code would immediately execute a scan on the scan class  
named My Slow Scan Class, even though it is only supposed to  
execute every minute.
```

```
system.tag.scan("MyProvider", "My Slow Scan Class")
```
