

# System Architectures

## Overview

Ignition is flexible enough to meet the demands of any enterprise infrastructure large, small, or somewhere in-between. You can deploy Ignition at one site, multiple sites, or host it in the Cloud. This section displays several common architecture examples. Many are simply examples, but are a great starting point. Additionally, the architectures shown below can be modified or scaled out to accommodate a number of different requirements.

Click on each architecture to learn more about it.
