

# Expression Functions

The expression language is used to define dynamic values for component properties and expression tags. Expressions often involve one or more other values that are used to calculate a final value. Expressions don't do anything, other than return a value.

For an overview and syntax of the expression language, see [Expression Language Overview and Syntax](#).

In this section, we cover all of the built in expression functions available inside Ignition. Each page will have a banner at the top that looks like this:

This function is used by **Ignition's Expression** language.

This lets you know that you are looking at a function for the expression language.
