

Database Connections

How Are Databases Used in Ignition?

While connecting to a database is not required for basic status and control functionality, it can dramatically increase the possibilities that the system offers. There are a few places where databases are used in Ignition, such as historical data logging, reporting, storing alarm logs, and as your Tags storage.

Historical Data Logging

Logging data for historical analysis, either through [Tags Historian](#) or with the [SQL Bridge module](#), requires a database connection. Databases are great at handling historical data, and by using a standard relational database your data is stored in an open format that can be used in many ways.

Reports, Graphs, and Charts

The Vision module makes it easy to present data stored in databases in a variety of ways. You can quickly create charts that show performance over time, locate anomalies, detect trends, and more. Furthermore, it's important to remember that it is possible to pull data from any database that Ignition is connected to, even if the data wasn't placed there by Ignition. This means you can tie in data from other sources or areas of your company, such as pulling in inventory and staff information, as well.

Storing Alarm Logs

[Store alarm information historically](#) and examine it later for patterns or trouble spots.

Getting Started with Databases

The first step in using a database with Ignition is to identify a database server. Many companies already have database servers maintained by their IT departments. If you do not, or wish to set up your own database server for Ignition, the [Supported Databases](#) section below offers some advice on choosing a database vendor.

Once you've identified a server, all you need to do is [create a connection](#) to that server to get up and running.

The screenshot shows the Ignition configuration interface. The left sidebar has a dark blue background with white text for navigation. The main content area is white with a green header bar at the top that says "Trial Mode 0:26:45 We're glad you're test driving our software. Have fun." and an "Activate Ignition" button. Below the header, there's a light blue box with a lightbulb icon and text: "Select the correct JDBC Driver for the type of database you wish to connect to. If no driver corresponds to your database, go to the Driver Configuration page to add a new driver." Below this are six driver options, each with a radio button and a description:

- MariaDB**: The MariaDB (a community-owned fork of MySQL) JDBC Driver - compatible with all MariaDB servers and MySQL 5.x (>= 5.5.3).
- Microsoft SQLServer**: The Microsoft SQL Server JDBC Driver is a Java Database Connectivity (JDBC) 4.2 compliant driver.
- MySQL**: The official MySQL JDBC Driver, Connector/J.
- Oracle Database**: The Oracle Database JDBC driver.
- PostgreSQL**: The official PostgreSQL JDBC Driver.
- SQLite**: Driver for the popular embedded database system.

A blue "Next >" button is located at the bottom right of the driver list.

Supported Databases in Ignition

Ignition has been tested with the following databases, and can connect to them directly after installation. You can connect to other databases by installing additional JDBC drivers (the Java database connection specification), which are often provided by database vendors.

Database	Version
Full Support	
MySQL	5.0+ for full support. Ignition can connect to 4.x, but many features such as Tags are not tested.
Microsoft SQL Server	2005, 2008, 2012, 2014, 2016, 2017 (full and express editions). Ignition can connect to 2000, but has not been fully tested.
Oracle	10g, 11g, 12c (full and express). The letters stand for "grid" and "cloud"
PostgreSQL	8.0+
Firebird	All versions.
IBM DB2	9.5+
SQLite	A driver for the popular embedded database system. This can be used to connect to an existing SQLite database, or create a new database: setting the connect URL property to a file that doesn't exist will result in the driver attempting to create the database.
Limited support	
Other JDBC drivers	Due to variances in databases, some features may not work fully through other non-tested JDBC drivers. However, it is usually possible to get full functionality through the careful use of the database translator feature. For example, the JDBC driver for MariaDB could be downloaded and added to Ignition.

Choosing other Databases

If you are new to working with SQL databases and are trying to choose a vendor, you need to consider the following three factors:

1- Existing company usage

Many companies already use SQL databases for other purposes, and thus most IT departments already have a defined standard. Going along with your company's existing standard is usually recommended, as there will already be staff available who are knowledgeable about the system. Furthermore, you may be able to tie into your company's existing database system instead of maintaining your own.

2 - Price and Features

The fully supported databases shown above vary dramatically in price. Some systems can cost thousands of dollars, but may have a free "express" edition that will work perfectly well for your requirements. Others offer advanced features such as redundancy, which are either not offered or difficult to configure in the other systems. It is therefore important to clearly define the features and capabilities that you need.

3 - Most common among Inductive Automation users

Choosing a database that is commonly used by Inductive Automation users means that you are more likely to find examples and help in the [Forum](#), among other benefits. The supported database list above is sorted according to our current user install base.

Installing and Connecting to a Database

Once you've identified a server, all you need to do is create a connection to that server to get up and running. See the [Installing Databases](#) and [Connecting to Databases](#) sections for details about how to install and connect to different databases through Ignition.

If we don't already have a connector for your database type, you can [simply add it in](#) yourself.

Database Drivers and Translators

What Is JDBC?

JDBC stands for the Java DataBase Connectivity API. It is a standardized way for Java-based applications to interact with a wide range of databases and data sources. A JDBC Driver enables Ignition to connect to, and use data from, a particular database system.

JDBC in Ignition

Ignition, being a Java-based application, leverages JDBC in order to connect to a variety of data sources. This enables Ignition to offer a standardized set of functionality on a wide range of different systems and databases. This includes not only commonly-used databases such as MySQL, Microsoft SQL Server, and Oracle, but additionally other lesser-known systems as well, provided the manufacturer offers a JDBC driver for the system.

Config > Database > Database Drivers & Settings

Trial Mode 1:59:05 We're glad you're test driving our software. Have fun. [Activate Ignition](#)

JDBC Drivers Translators

Name	Driver Type	Default Translator	Status		
MariaDB	MySQL	MYSQL	Installed	delete	edit
Microsoft SQL Server	Microsoft SQL Server	MSSQL	Installed	delete	edit
MySQL	MySQL	MYSQL	Installed	delete	edit
Oracle Database	Oracle	ORACLE	Error - either required files are missing or classname is incorrect	delete	edit
PostgreSQL	PostgreSQL	POSTGRES	Installed	delete	edit

→ [Create new JDBC Driver...](#)

Note: Please see [this help page](#) for information about installing driver files that are not able to be bundled with Ignition.

Monitoring Connection Status

The state or status of a database can be monitored from the [Status](#) section of the Gateway Webpage, under **Connections > Databases**. The status panels show the current state and a fault message, if applicable, or throughput statistics if the connection is active.

When a connection is not available, it is re-tested every 10 seconds, and the status is updated.

Config > Database > Database Connections

Name	Description	JDBC Driver	Translator	Status		
DB		MariaDB	MYSQL	Faulted	delete	edit
MSSQL		MySQL	MYSQL	Valid	delete	edit
SQLServer		Microsoft SQLServer	MSSQL	Reconnecting	delete	edit

→ [Create new Database Connection...](#)

Note: For details about a connection's status, see the [Database Connection Status](#) page.
